Agenda

- What is Serverless Computing
- Functions as a Service
- Serverless Options
- Azure Functions Overview
- Azure Functions in Action
- Pricing
- Best Practices

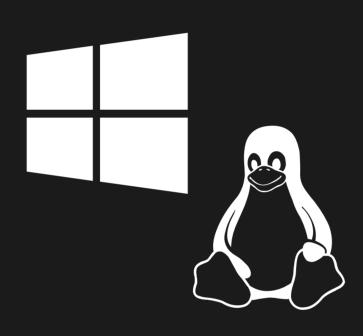

On-Premises

What is the right **size** of servers for my business needs?

How can I increase **server** utilization?

How many **servers** do I need?

How can I scale my application?

How often should I patch my servers?

How often should I backup my server?

Which packages should be on my **server**?

How do I deploy new code to my server?
Which Operating System should I use?
Who monitors my application?

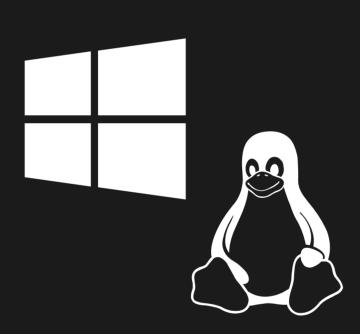

O

What is the right **size** of servers for my business needs?

How can I increase **server** utilization?

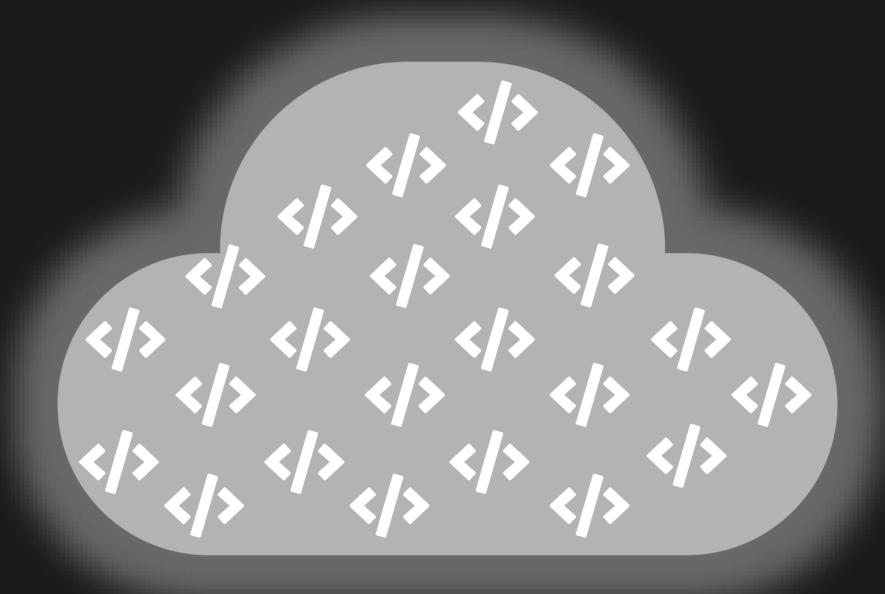

How many **servers** do I need?

How can I scale my application?

The platform for next generation applications

PaaS

Serverless

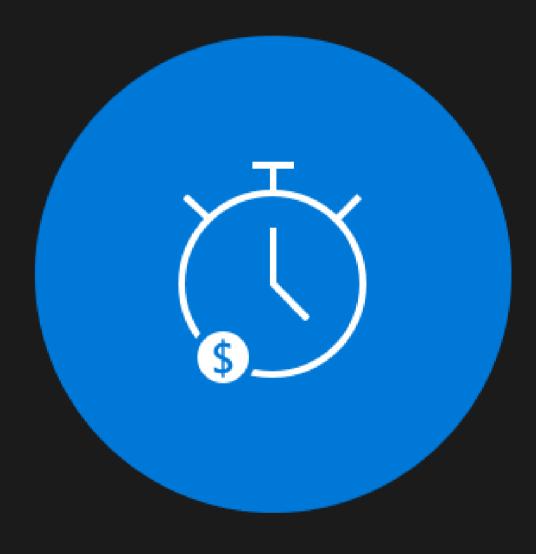

What is Serverless?

Abstraction of Servers

Event-Driven/Instant Scale

Micro-Billing

Benefits of Serverless

Manage apps not servers

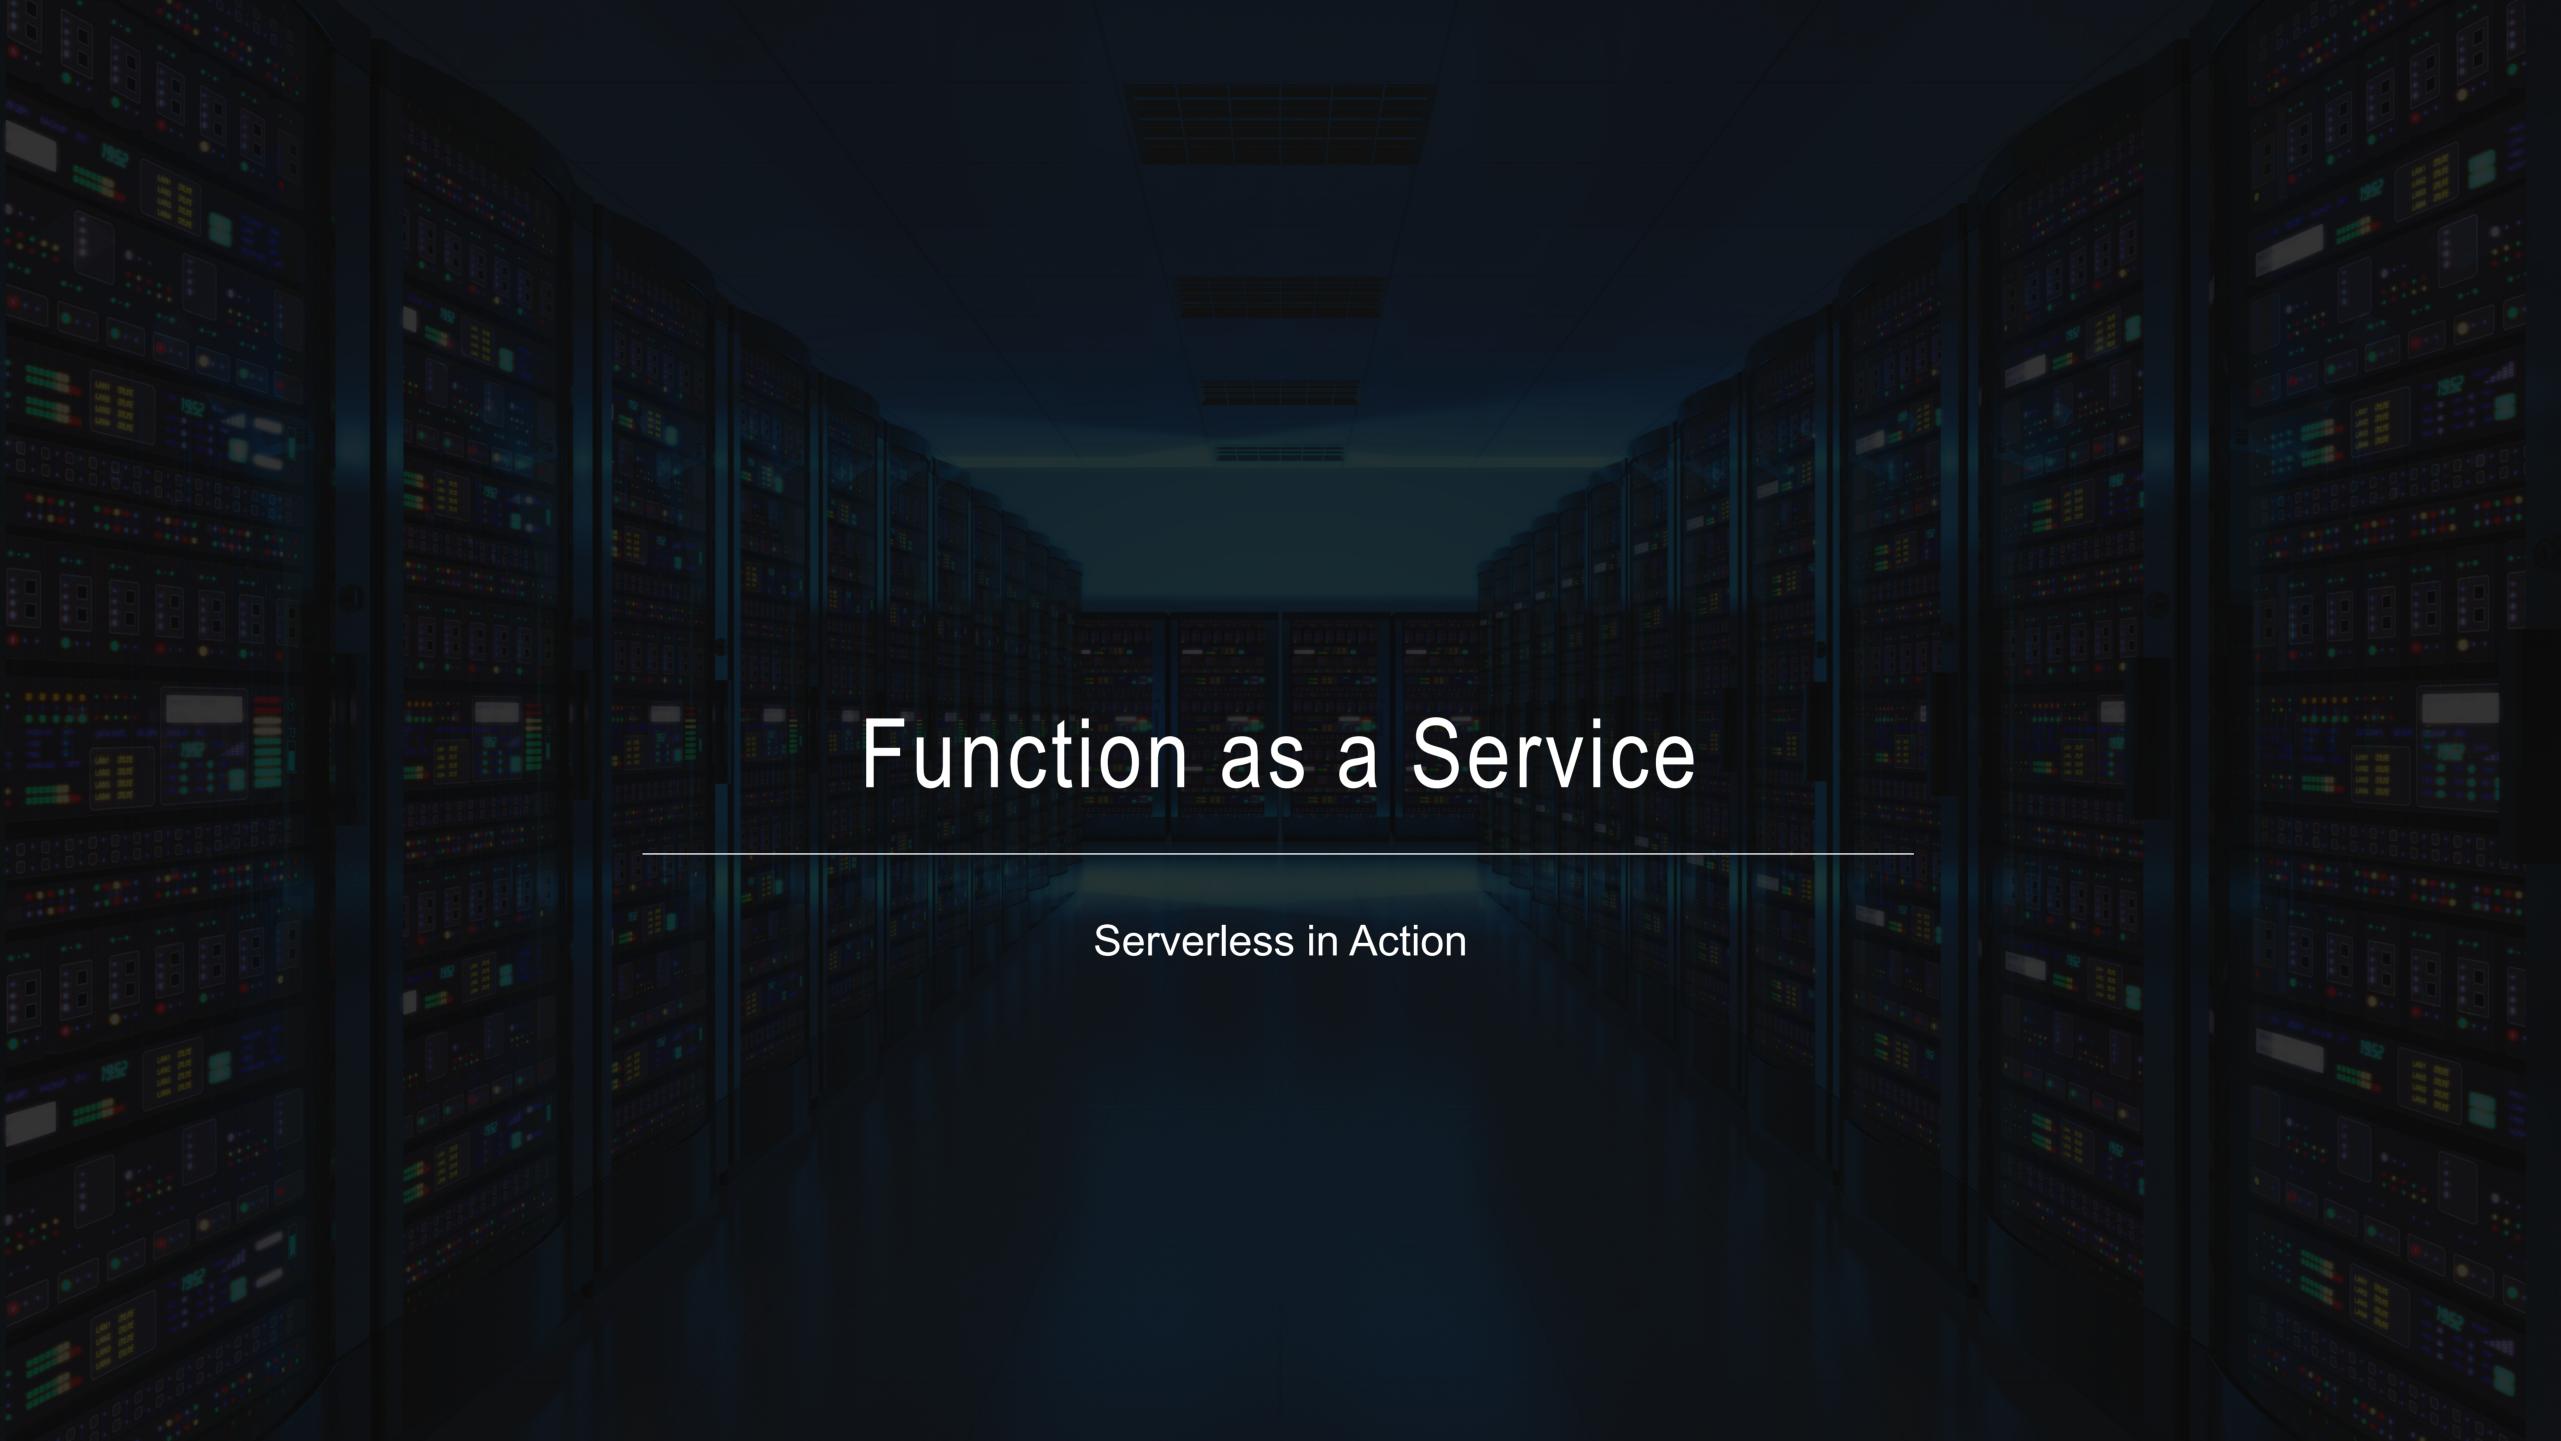

Reduced DevOps

Faster Time to Market

Challenges of Serverless Architecture

Serverless is more than just one thing

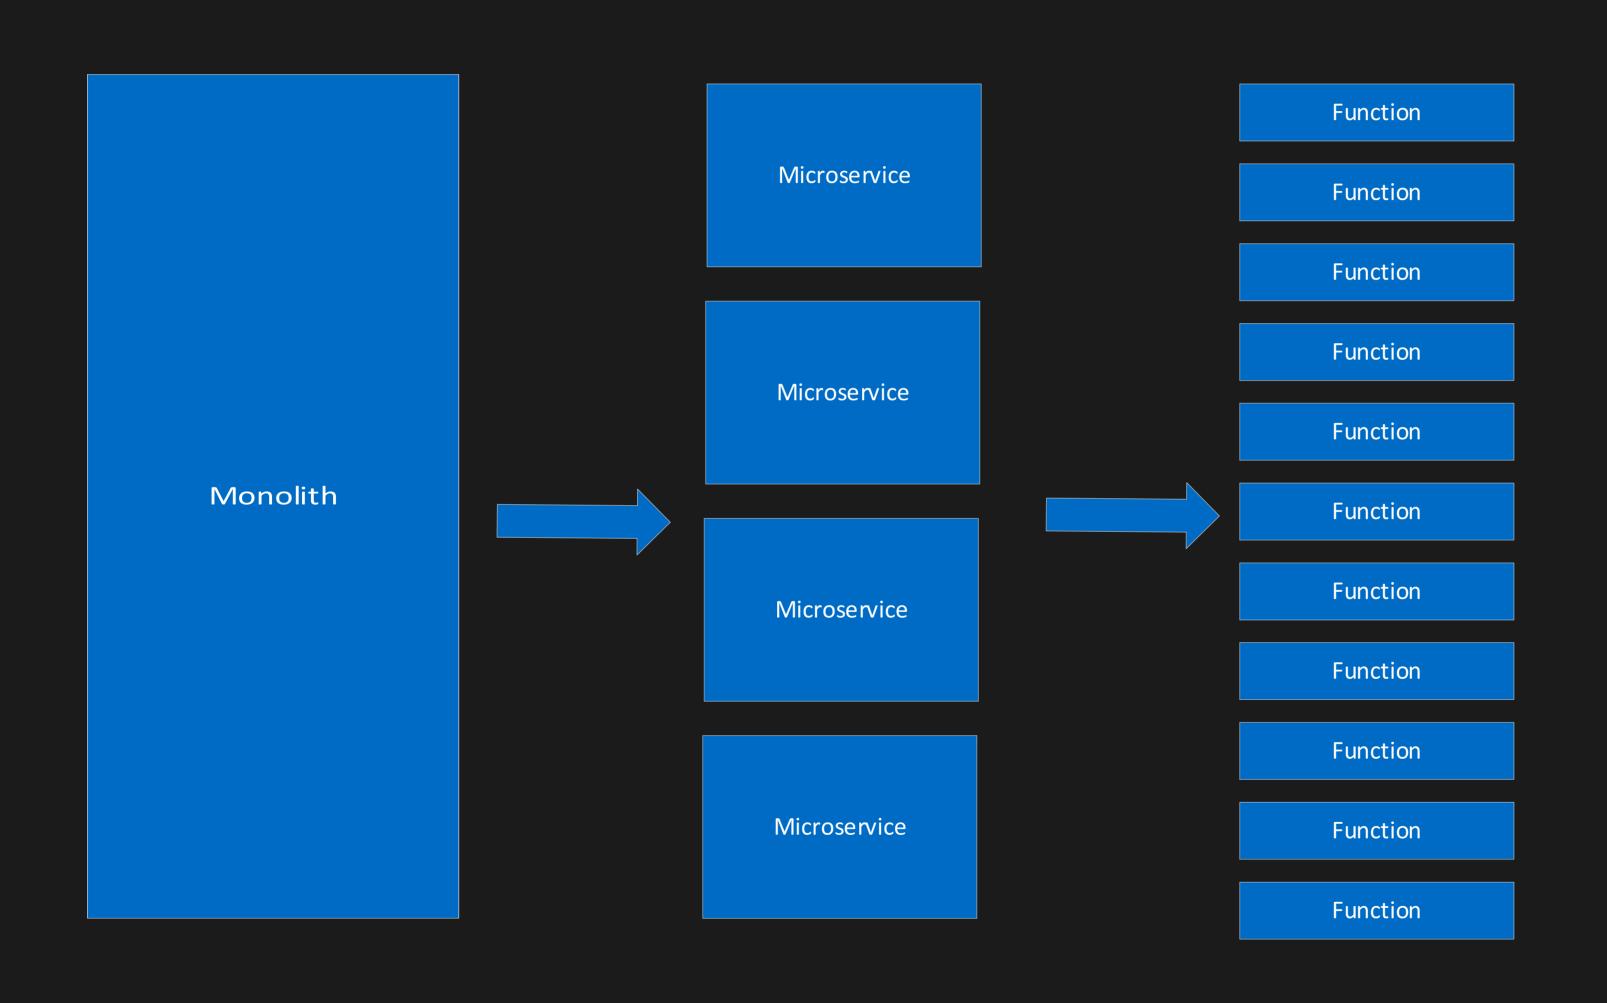

Backend as a Service (BaaS)

 Applications that significantly or fully depend on services (in the cloud) to manage server-side logic and state

Functions as a Services (FaaS)

 Application run in stateless compute containers that are event-triggered, ephemeral, and fully managed by a 3rd party

Function Scale

Nano Services

FaaS is at the center of serverless

Single responsibility

Functions are single-purposed, reusable pieces of code that process an input and return a result

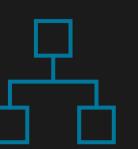

Short lived

Functions don't stick around when finished executing, freeing up resources for further executions

Stateless

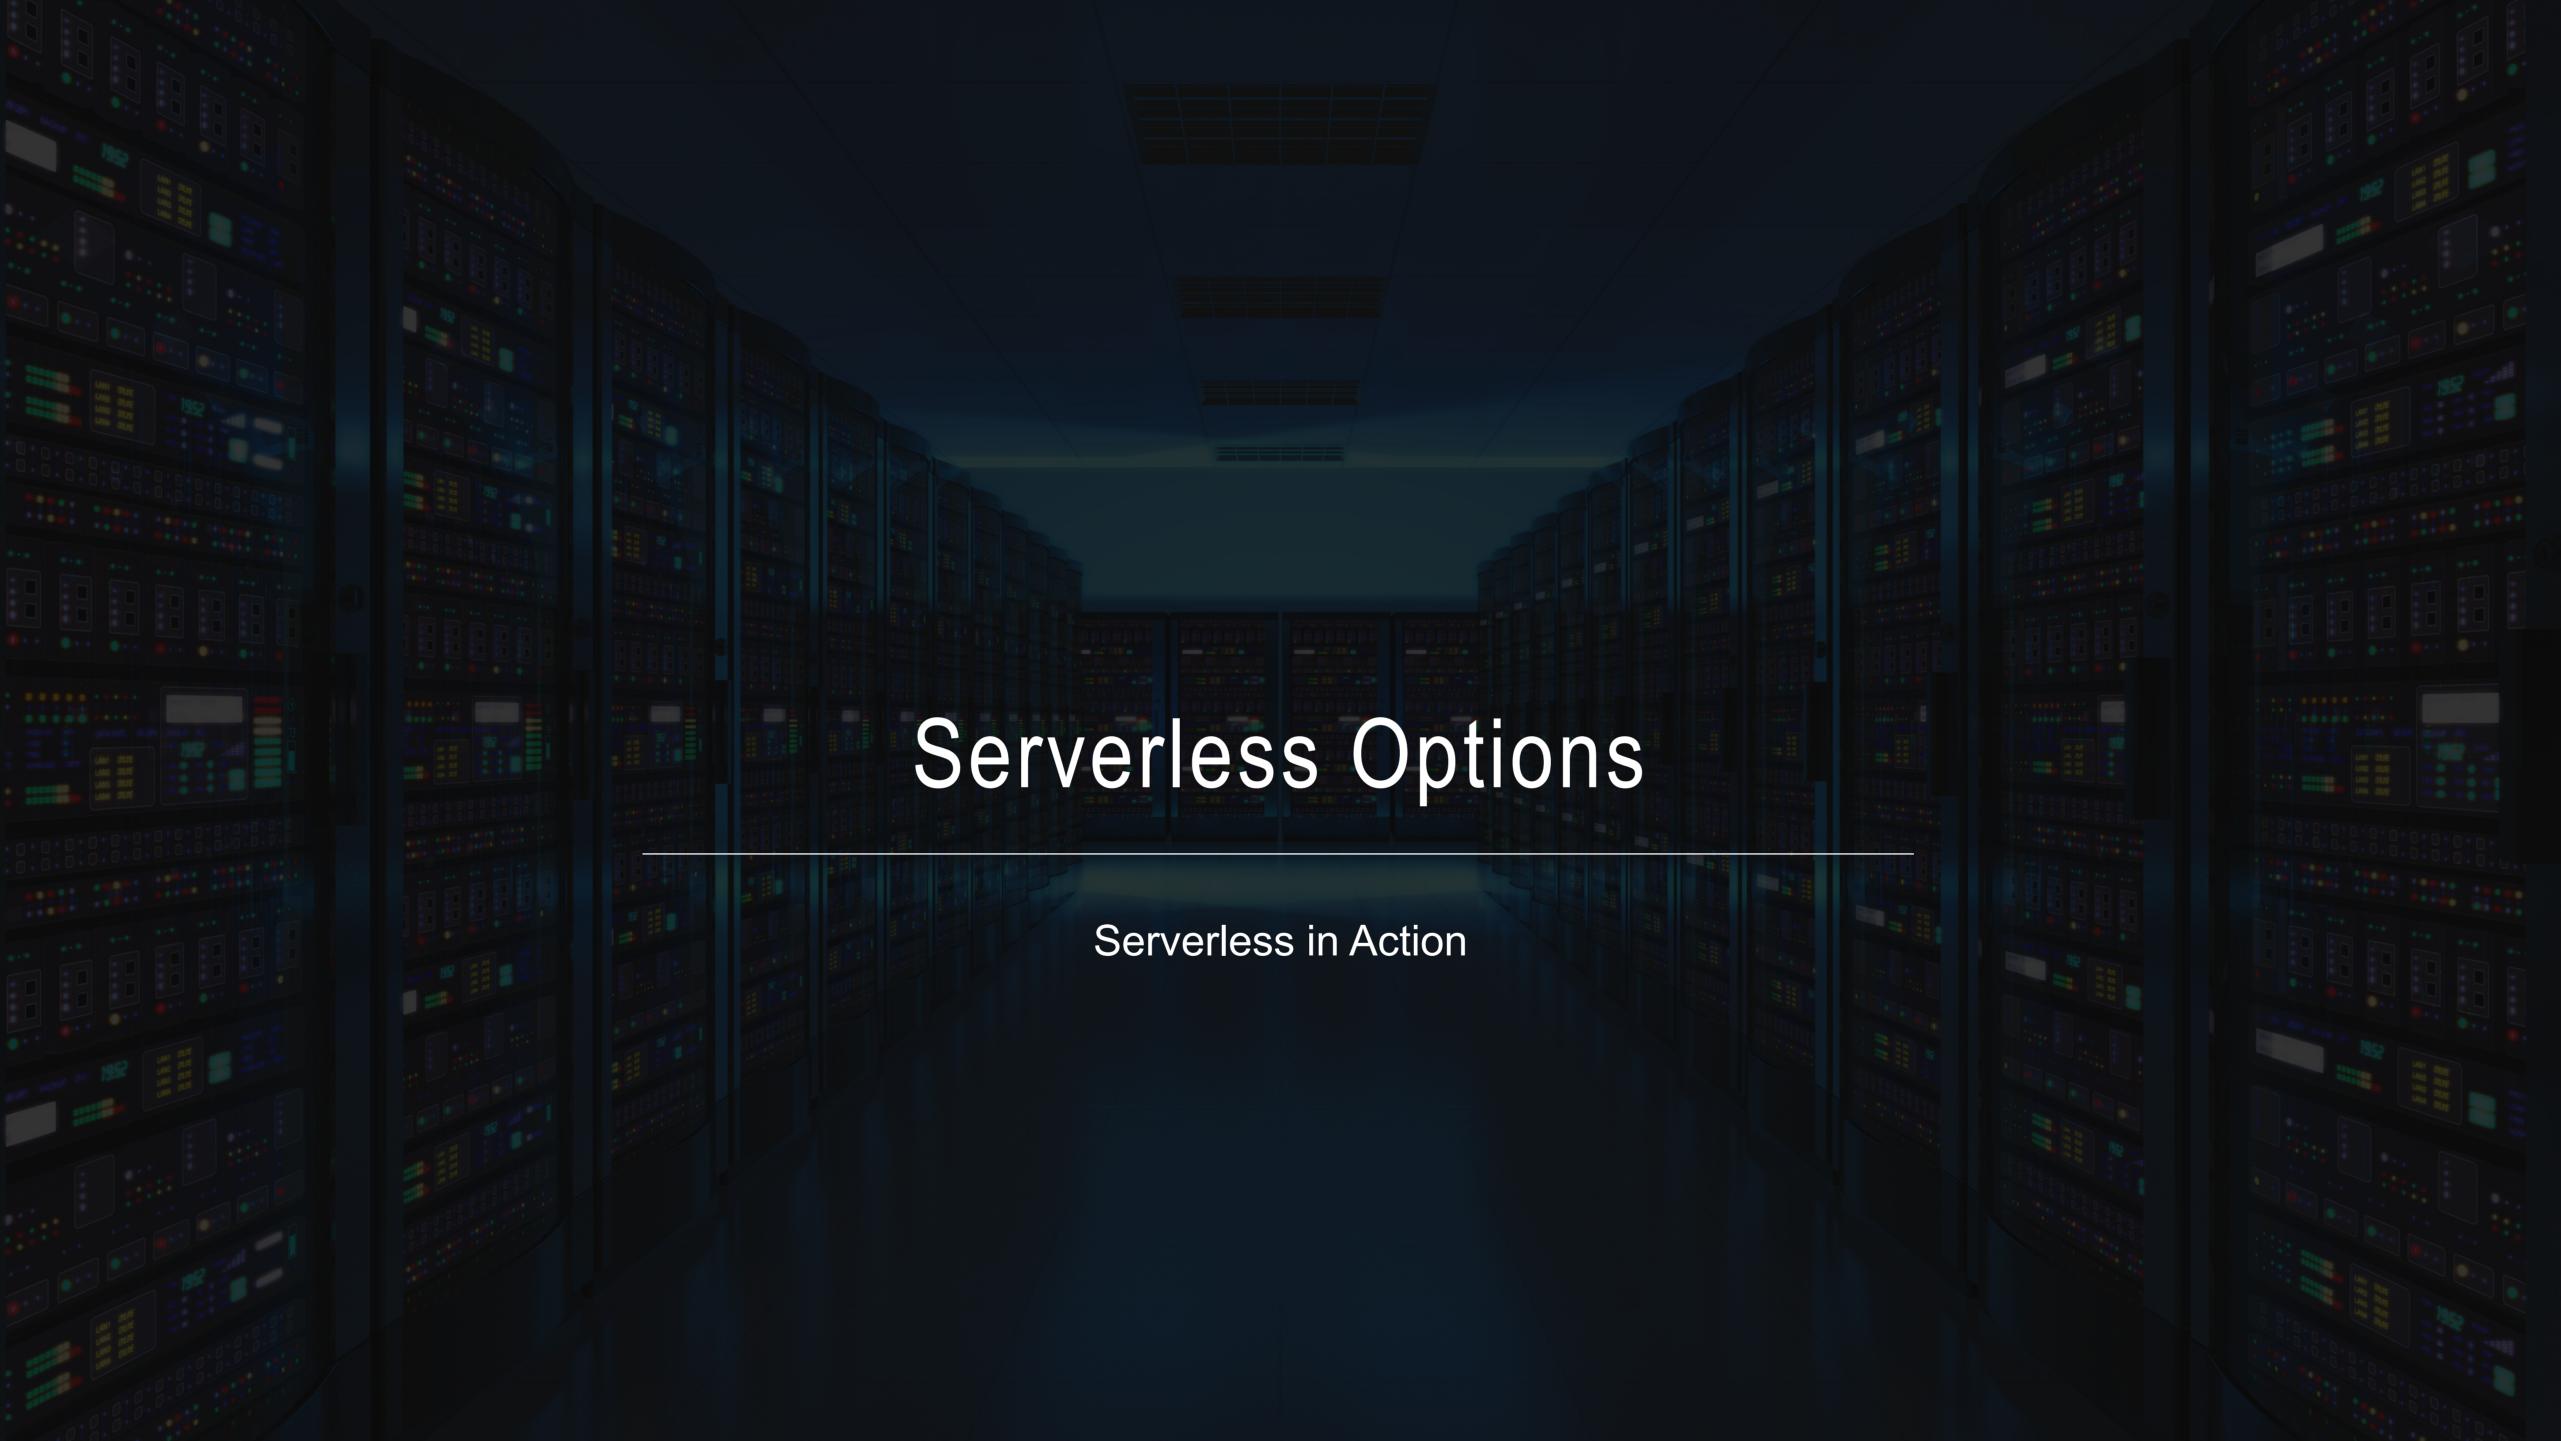

Functions don't hold any persistent state and don't rely on the state of any other processes

Event driven & scalable

Functions respond to predefined events, and are instantly replicated as many times as needed

Functions-as-a-Service programming model use functions to achieve true serverless compute

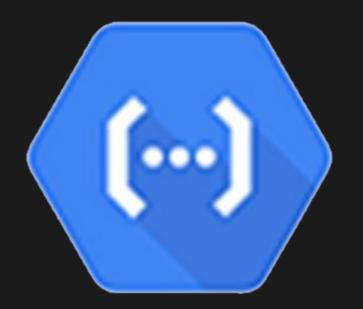

Run code without thinking about servers. Pay only for the compute time you consume.

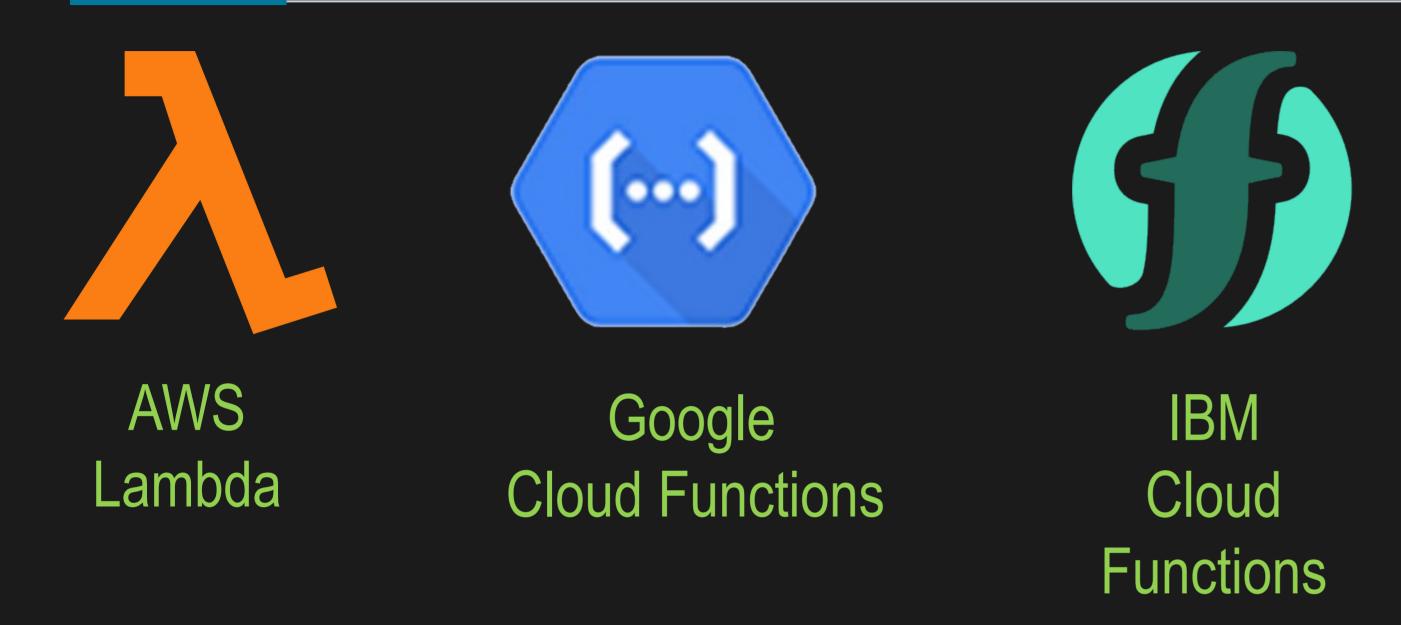

Google
Cloud Functions

Event-driven serverless compute platform

Execute code on demand in a highly scalable serverless environment

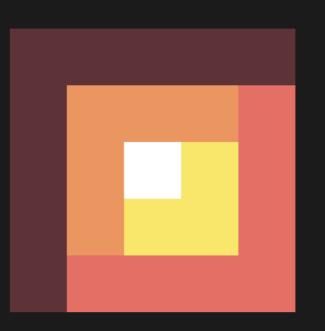

AWS Lambda

Google
Cloud Functions

IBM
Cloud
Functions

Auth0 WebTask

All you need is code

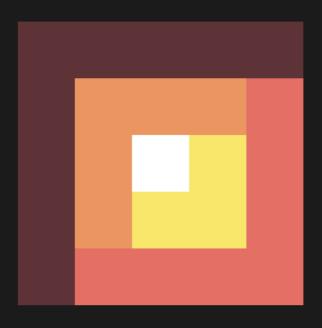

AWS Lambda

Develop How You Want

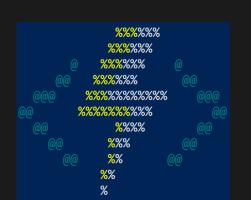

- Azure Portal
 - Quickly get started without having to install anything else

- Visual Studio 2017
 - First class C# development experience

- Visual Studio Code
 - First class Node.js development experience
 - Edit any function project generated via CLI

- Azure Functions Core Tools (CLI)
 - Build any kind of function and edit in IDE of your choice

Runtime Versions

Runtime 1.x

• .NET Framework 4.6

Runtime 2.x

- .NET Core 2.0
- Cross Platform
- Language Extensions
 - Java
- Binding Extensions
 - Microsoft Graph
 - Durable Functions

Runtime Version Languages

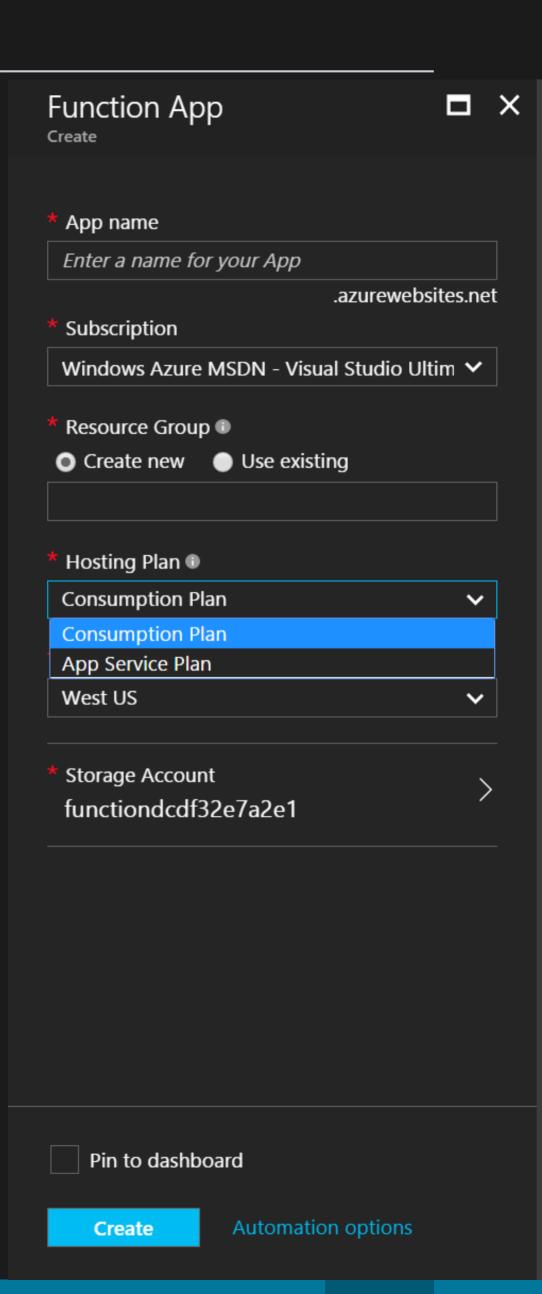

Language	1.x	2.x
C#	GA (.NET Framework 4.7)	GA (.NET Core 2.2)
JavaScript	GA (Node 6)	GA (Node 8 & 10)
F#	GA(.NET Framework 4.7)	GA (.NET Core 2.2)
Java	N/A	Preview (Java 8)
Python	Experimental	Preview (Python 3.6.x)
TypeScript	Experimental	GA (Supported through transpiling to JavaScript)
PHP	Experimental	N/A
Batch (.cmd, .bat)	Experimental	N/A
Bash	Experimental	N/A
PowerShell	Experimental	Preview (PowerShell Core 6)

Consumption Plan

- Pay for what you use without the need to reserve compute resources.
- Function Apps are assigned to compute processing instances that are scaled dynamically by the platform.
- Functions can have multiple parallel executions minimizing the total time needed to process requests.
- Cost is driven by the number of executions and by accounting for memory size used and total execution time across all functions in a Function App as measured in gigabyte-seconds.

Selection guidance

 Good option if your functions run at elastic scale with potentially intermittent executions.

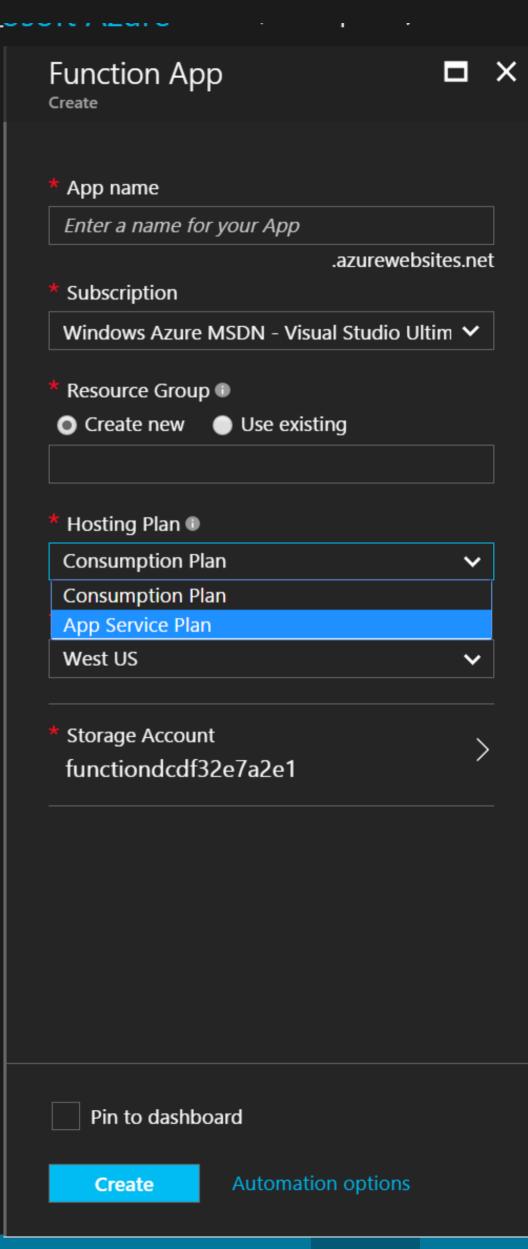

App Service Plan

- Function Apps run on dedicated VMs, just like Web Apps work today
- Dedicated VMs are allocated to your apps and they are always available whether code is being actively executed or not.

Selection guidance

- Good option if you have existing, under-utilized VMs that are already running other code
- Good option if you expect to run functions continuously or almost continuously

Premium Plan

	Consumption Plan	-New- Premium Plan (Preview)	
Instance Size	Fixed at one core and 1.5Gb of memory	Configurable up to 4 cores and 14Gb of memory	
Scaling	Event driven scaling	Event driven scaling	
Scale Controls	None	Set min and max instances	
Private Networking	None	VNET integration	
Warmup Time (Cold Start)		No delay after your app is inactive and scale instantly to pre-warmed instances	
Cost	l la companya di managanta di ma	Consumption and at least 1 pre-warmed instance per plan	

Ways to Run Functions

Consumption Serverless

Pay only for what you use! Metering is per execution and per Gb second.

App Service Plan Free Pagio

Free, Basic, Standard, Premium

All the advantages of Functions with the SLA and 'always on' feature of an App Service Plan

App Service Environment Network Isolation

Your own dedicated cloud environment with network isolation for apps, higher scale, and the ability to connect securely to local vNets.

Azure Stack On Premises

Leverage cloud innovations in onpremises infrastructure.
Azure Stack brings the power of Azure to your data centers.

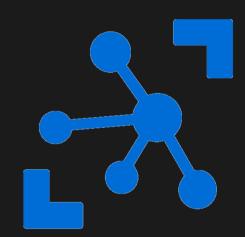

Azure Functions Runtime

Functions on your Server

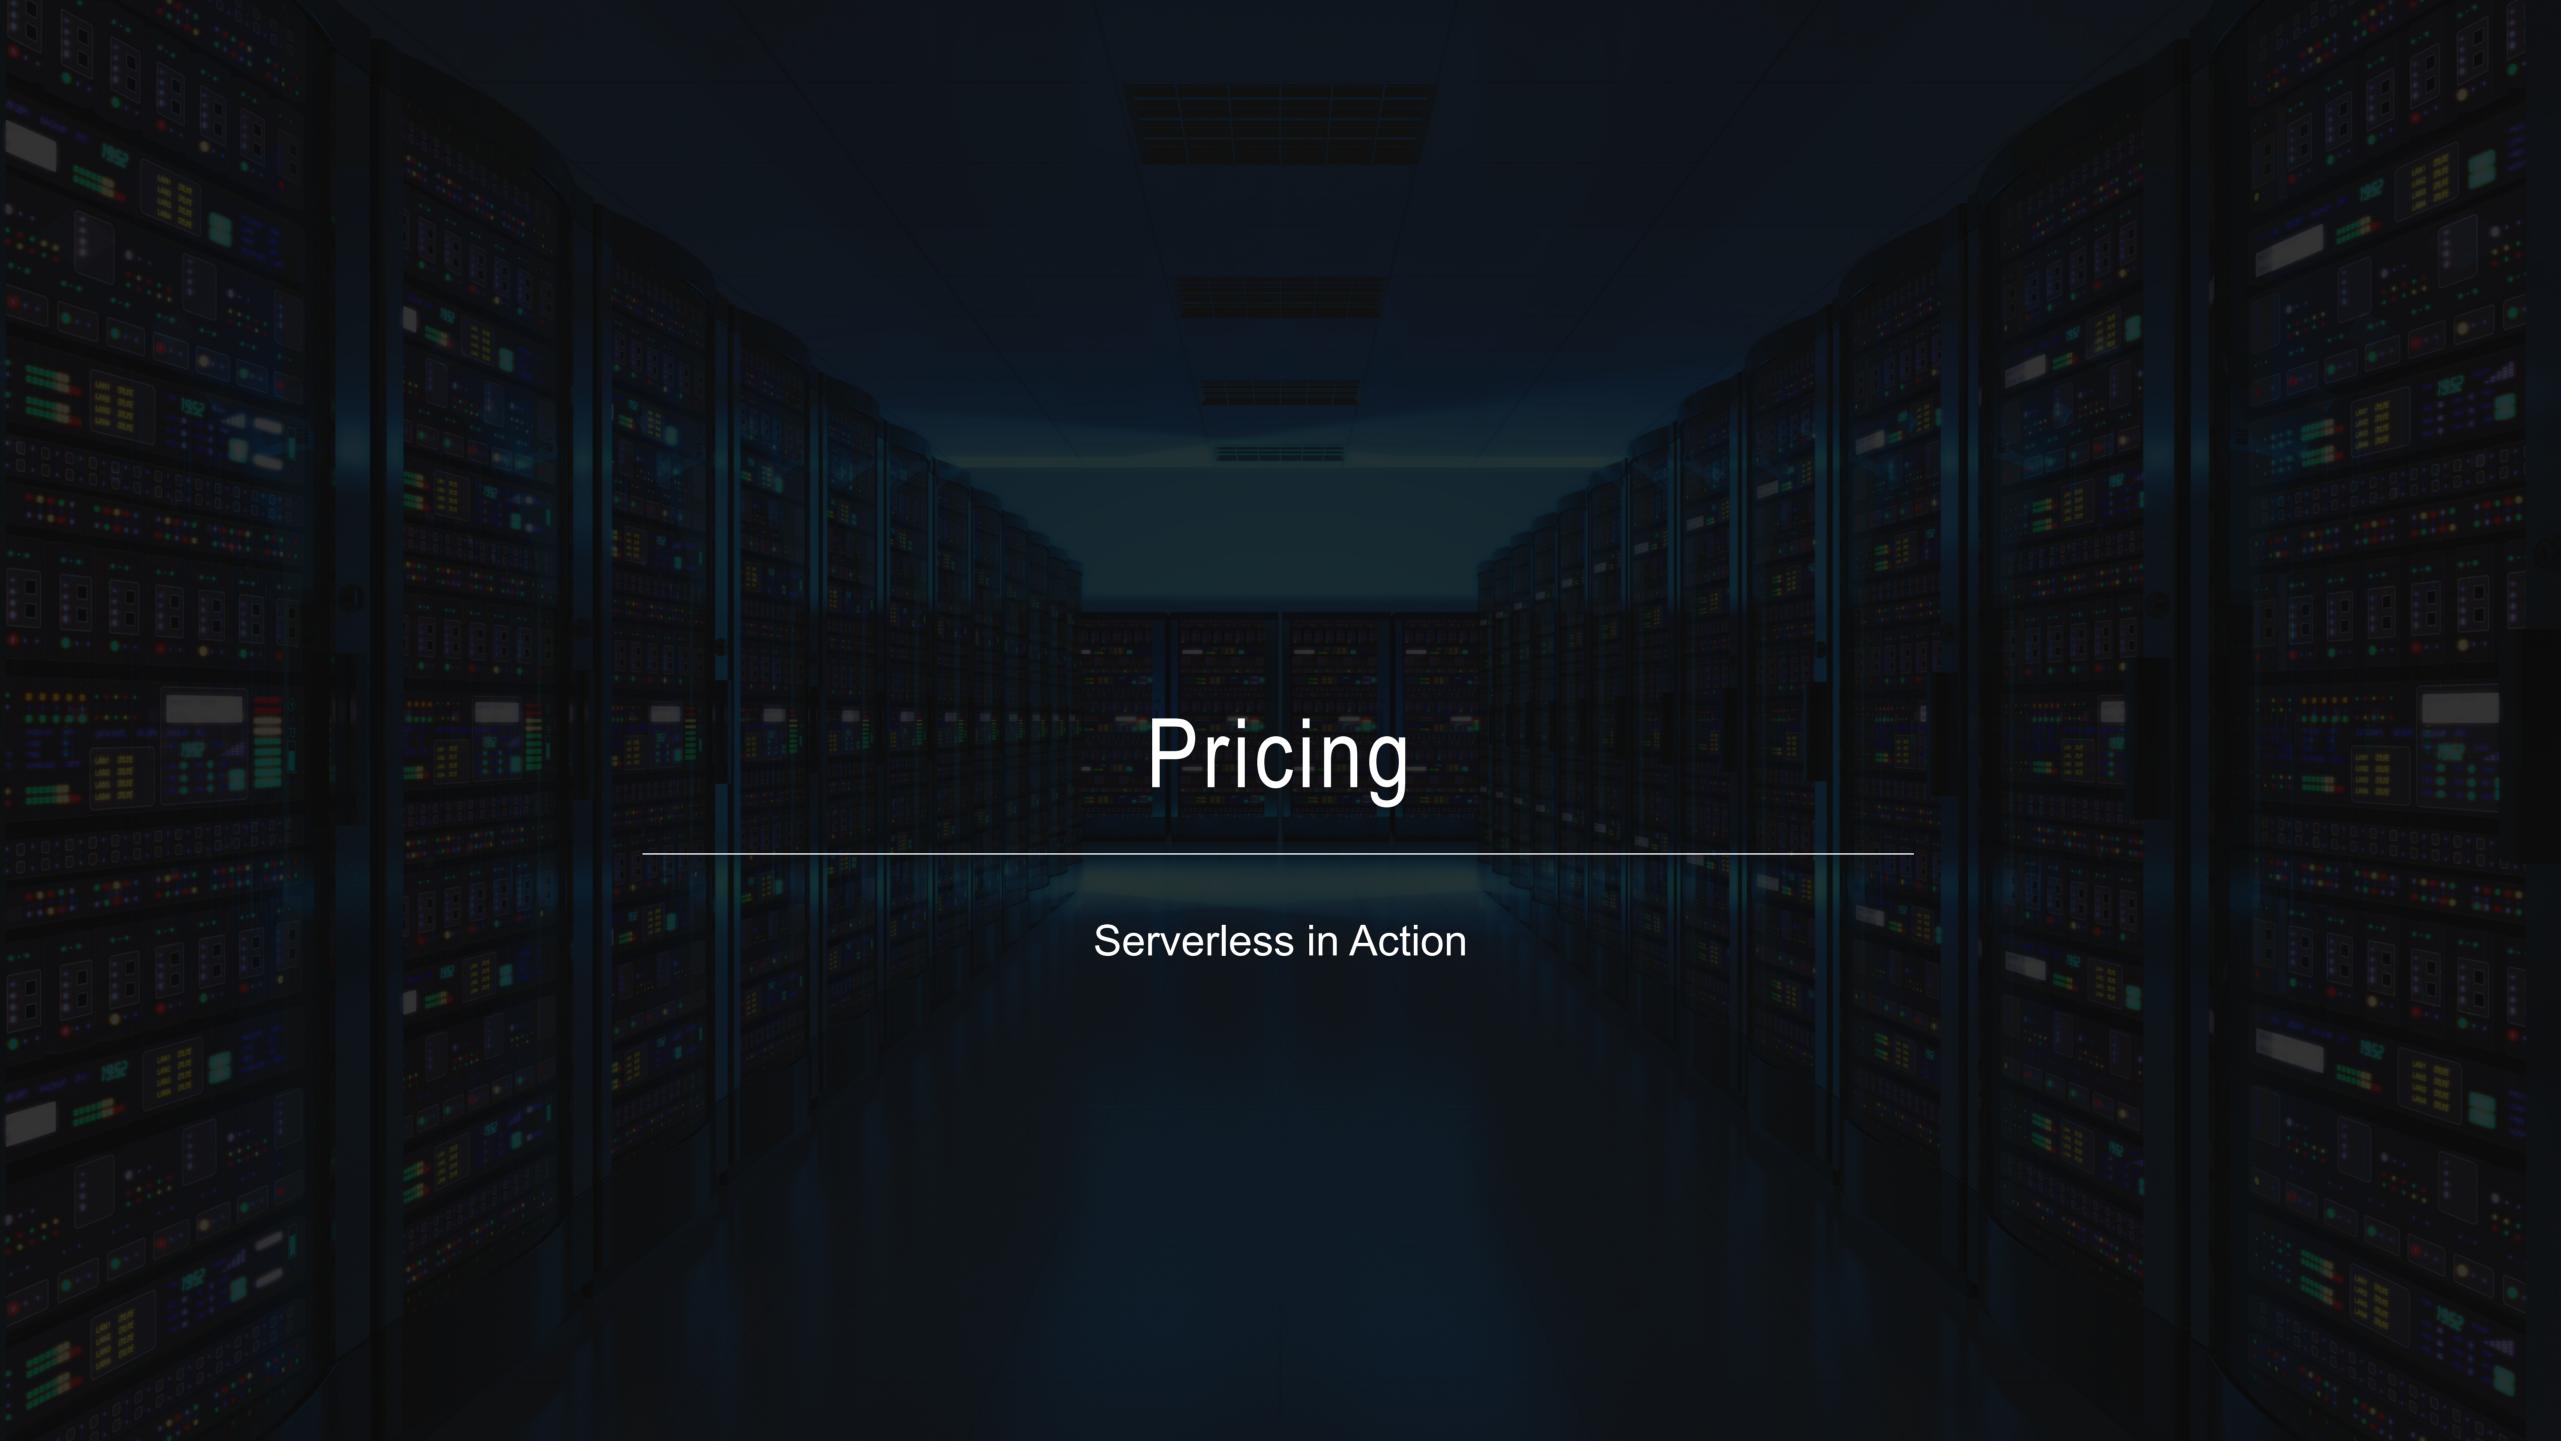

Run your Azure
Functions on our
local server
(without the rest
of Azure)

Azure IoT Edge On Devices

Run on IoT
Devices by
deploying custom
modules.

Pricing – General Information

- No upfront cost
- No termination fees
- Pay only for what you use

Consumption Plan Pricing

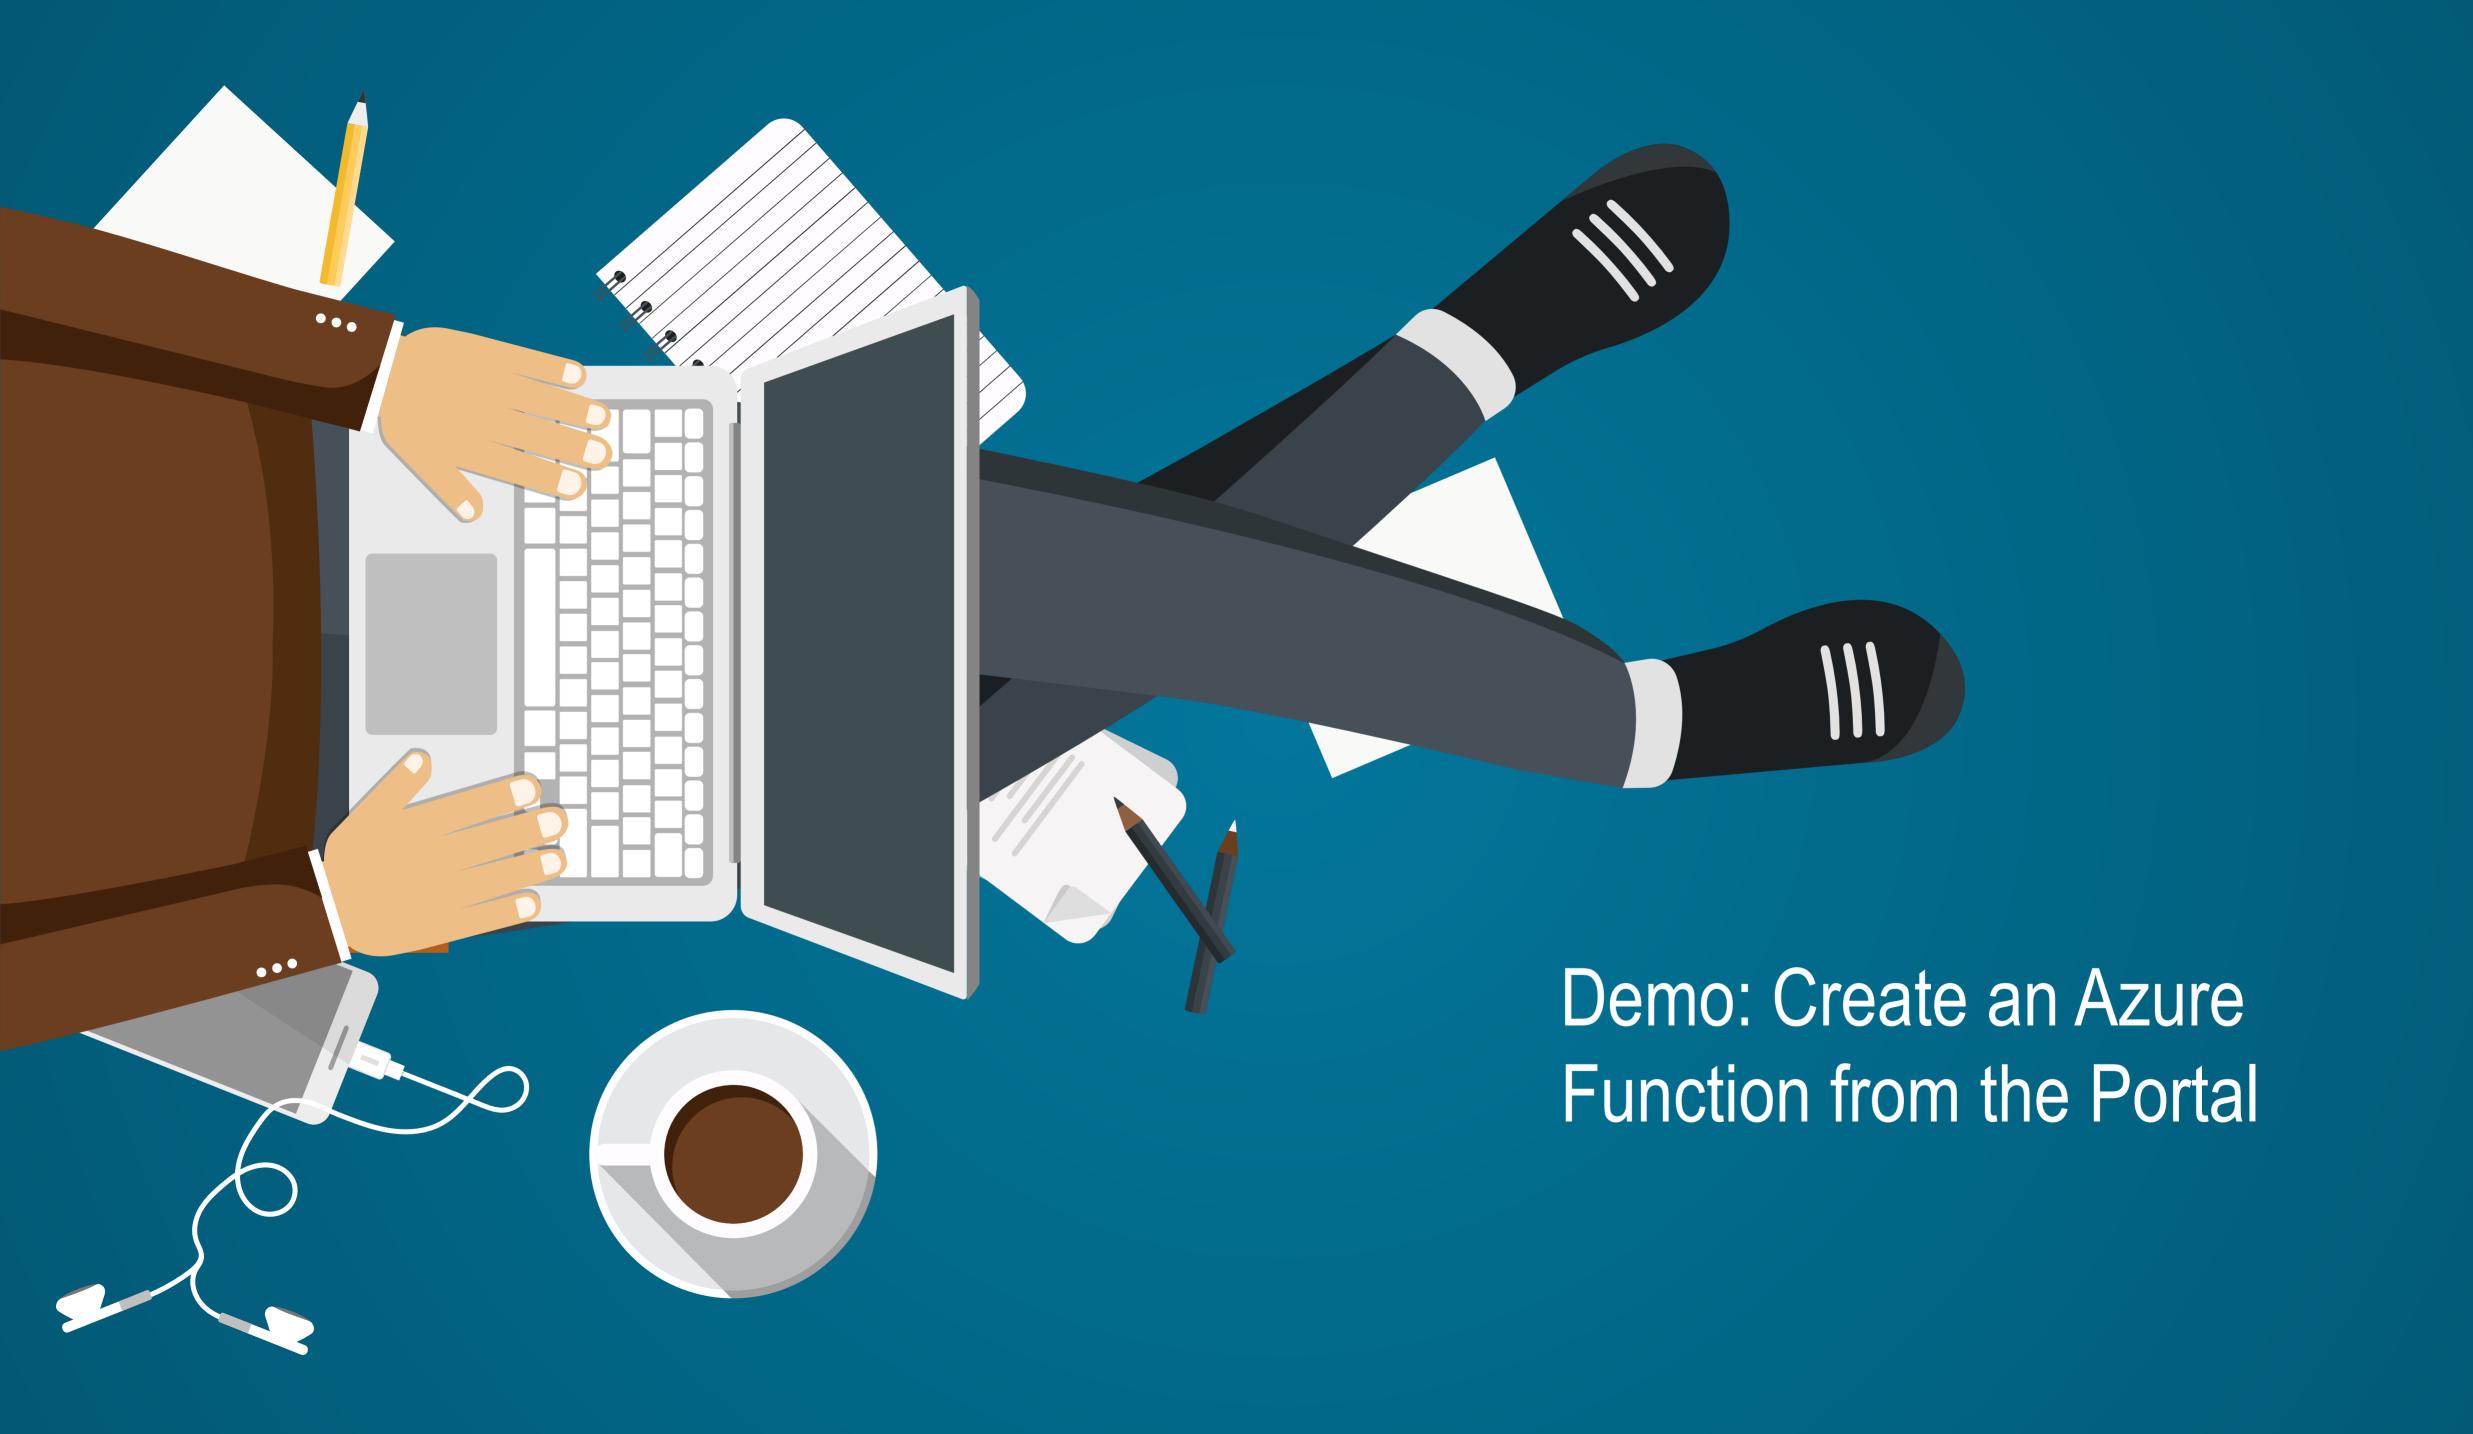

Meter	Price	Free Grant
Execution Time	\$0.00016 per Gb-s	400,000 GB-s
Executions	\$0.20 per million executions	1 million executions

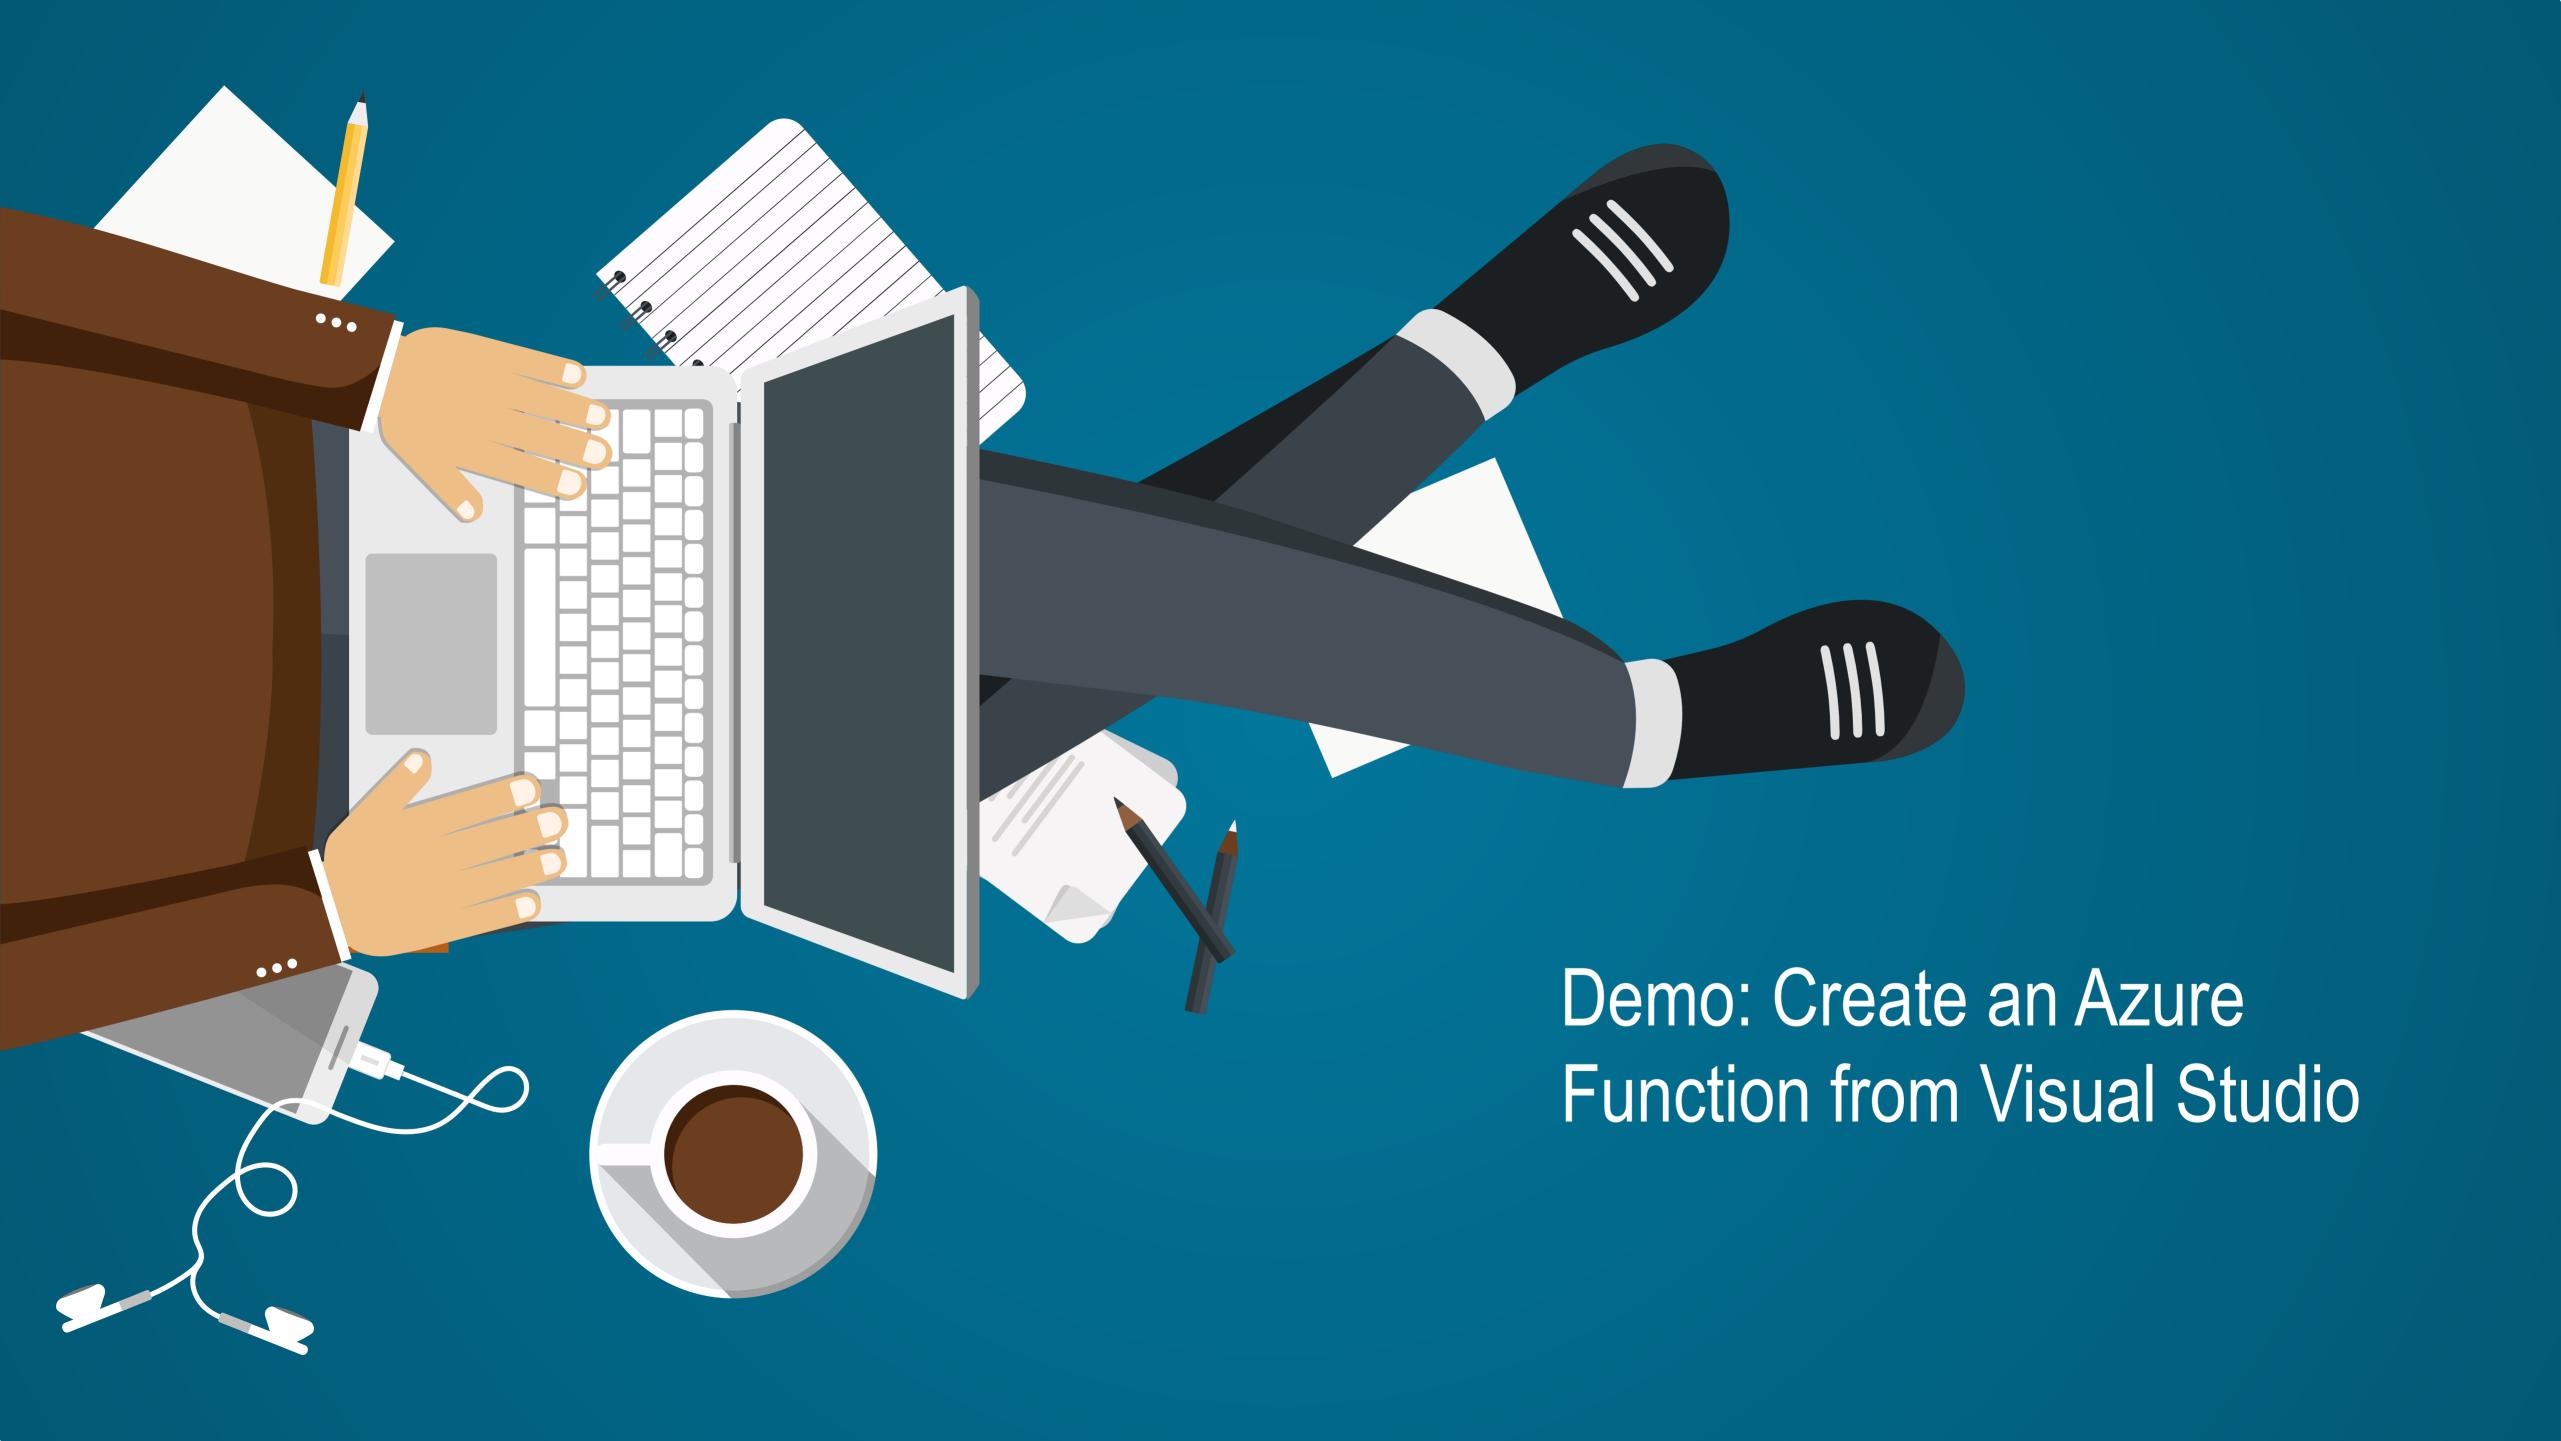

- Gigabyte-second (GB-s) Combination of memory size and execution time
- Executions Each time a function is executed

Pricing Example

- Execution Time
 - 3 million executions x 1 second per execution = 3 million seconds
 - Resource consumption of 512-Mb → 1.5 million GB-s
 - 1.5 million GB-s minus grant of 400,000 Gb-s = 1.1 million Gb-s
 - Execution Total = \$17.60
- Executions
 - 3 million executions minus grant of 1 million executions = 2 million executions
 - 2 million transactions at 20 cents per million = \$0.40
- Grand Total: \$18.00

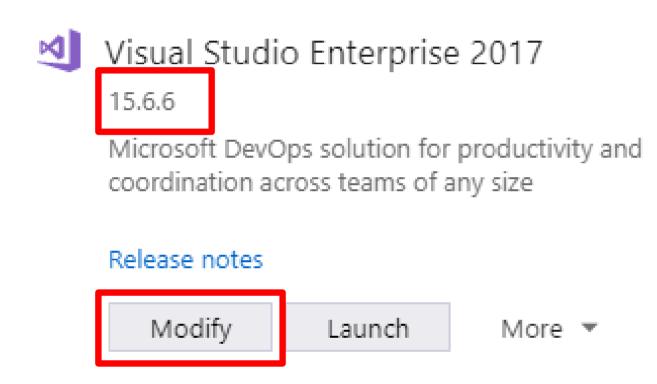

Visual Studio Installer

Function Timeouts

- Default timeout of 5 minutes
- Maximum timeout of 10 minutes
- For longer running functions use the App Service Plan and/or Durable Functions

The absolute minimum best practices

- Functions should do one thing
- Functions should be idempotent
- Functions should finish as quickly as possible

Avoid long running functions

- Avoid long running functions
- Cross function communication

- Avoid long running functions
- Cross function communication
- Write functions to be stateless

Durable Functions

More capabilities coming in near future

- Avoid long running functions
- Cross function communication
- Write functions to be stateless
- Write defensive functions

Testing Your Functions

- Recommended Way
 - Abstract logic away from the Function and test that abstraction
- But I really need (want) to test the actual Function
 - Within test project, you will need to create a class that implements the ILogger which will be passed into the Functions

 Do not mix test and production code in the same function app

- Do not mix test and production code in the same function app
- Use async code but avoid blocking calls

- Do not mix test and production code in the same function app
- Use async code but avoid blocking calls
- Receive messages in batch whenever possible

- Do not mix test and production code in the same function app
- Use async code but avoid blocking calls
- Receive messages in batch whenever possible
- Configure host behaviors to better handle concurrency

How to get started

- Start small, replace 1 API or background processing item
- Integration is a great place, often it's a new layer on top of old layers
